How to deploy on Heroku?

We recommend you read the [Heroku documentation for Node.js](#).

Watch a free lesson on **How to deploy Nuxt.js to Heroku** on Vue School

First, we want our application to listen on the host `0.0.0.0` and run in production mode:

```
heroku config:set HOST=0.0.0.0
heroku config:set NODE_ENV=production
```

You should see this in your Heroku dashboard (Settings section):

Config Variables

Config vars change the way your app behaves. In addition to creating your own, some add-ons come with their own.

Config Vars

HOST	0.0.0.0		
NPM_CONFIG_PRODUCTION	false		
NODE_ENV	production		
KEY	VALUE		

Heroku uses a [Procfile](#) (name the file `Procfile` with no file extension) that specifies the commands that are executed by the apps dynos. To start the Procfile will be very simple, and needs to contain

This will instruct run the `nuxt start` command and tell heroku to direct external HTTP traffic to it.

Finally, we can push the app on Heroku with:

```
git push heroku master
```

To deploy a non-master branch to Heroku use:

```
git push heroku develop:master
```

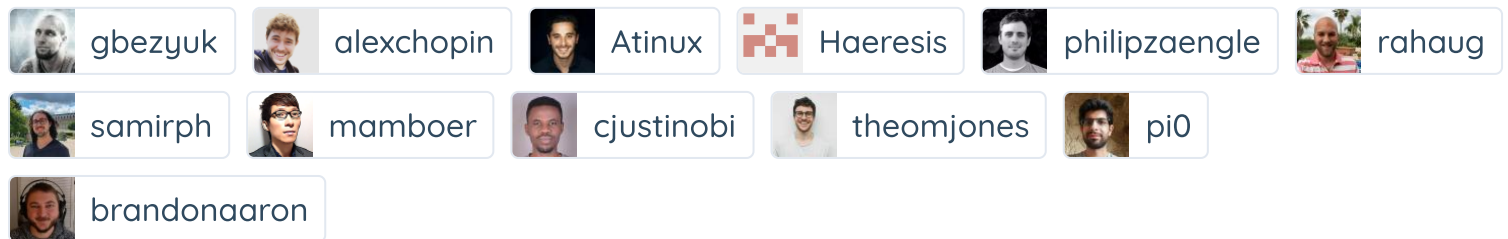

where `develop` is the name of your branch.

Voilà! Your Nuxt.js application is now hosted on Heroku!
